

Website name : Canopus Technologies

Description :

Cano Tech is a personal startup company idea that I have come up with recently. In hindsight it would be a part of another company's (gym,health wellness studio, or any monthly subscription place) customer database. It would employ predictive tech software to calculate the customer churn of the company and spit out a risk analysis of a said customer leaving the company. For example a customer's visits going down from 7 days a week to 3 days a week for 3 weeks straight and the customer only utilizing one specific benefit instead of the usual 4 or 5 benefits that the customer utilizes on visits.

In relation to that, the specific website used for this class project will just be a place that captures customer data. Like mentioned earlier, daily visits per week, benefits used per visit, and any other important information that wellness companies usually capture from customers to analyze if that customer is at risk of cancelling or not. Simply the website will be centered around storing,viewing and editing customer data in a realistic professional environment for membership-based businesses

Page Names: Home, Customer Directory, Customer Management, Data Overview, About and Contact
